

## **Feedback and decisions**

Our questions during this technical review hit three main points on our project. First, we asked for ideas on how to use our polar plots. This was useful in that we received feedback on which colleges would be interesting to compare to each other, as well as which categories we should compare them in. Receiving suggestions for that definitely helped us move forward in the implementation of our polar plot comparisons. Second, we asked for ideas on how to structure a page on which survivors could add themselves, and did not receive many useful answers. Third, we also asked for any ideas on what else we could do to create understandable, interesting visualizations. This led to the suggestion of shading the states based on each's assault rate (regardless of location other than within that state). We did work on implementing such a visualization immediately following the review, and found it to be an interesting visualization.

## **Review process reflection**

The review was a success. We got answers to our key questions and inspiration for more ways to expand our project. We stuck mainly to our agenda and had questions sprinkled throughout the presentation to facilitate group discussion. Our audience was familiar with our project by that point and had a solid understanding of what our goals were, but we did need to go over that our maps were showing schools that reported zero versus non-zero. The lack of reporting any numbers was what surprised us the most when collecting the data and is an inaccurate representation of the amount of sexual misconduct occurring on college campuses. It took some time to convey this completely to the audience. We definitely could've asked for more feedback on how to go about accomplishing some of the bumps we ran into as well as how to make some of our different visualizations and stretch goals happen. We eventually were able to make the website input much more possible after Celina started learning how to work with HTML and CSS and started building a webpage, but this wasn't from advice from the tutorial.
